EN_BIOSMALTO EROSION PROTECTION

BIOSMALTO

MOUSSE MOUTHWASH

50ml - It contains 250 ppm di F⁻

- Helps protect against acid erosion
- Slows the enamel dissolution
- Prevents teeth yellowing
- Helps protect against tooth sensitivity

Suggested use in combination with toothpaste Biosmalto Erosion Protection.

TOOTHPASTE

75 ml - It contains 1450 ppm di F⁻

- Helps protect against acid erosion
- Slows the enamel dissolution
- Prevents teeth yellowing
- Helps protect against tooth sensitivity

Suggested use in combination with mouthwash Biosmalto Erosion Protection.

Toothpaste for adults.

WARNINGS: Do not swallow. For external use only. Keep out of the reach of children. Do not use in case of hypersensitivity or allergy to one or more components. Keep away from light and heat sources. Dispose of the container properly after use.

DENTAL EROSION

Enamel and dentin are two highly mineralized tissues, whose basic constituent is a "mineral" organized in hexagonal crystals that is called **HYDROXYAPATITE.** Dental erosions are the result from progressive loss of hard tissue on tooth surface due to acidic substances from the outside the body (food) or from inside (e.g. reflux) leading to exposure of the dentin and consequent yellowing and increased sensitivity of the teeth. The daily consumption of acidic drinks and/or foods, energy drinks and carbonated drinks or the presence of problems, such as gastroesophageal reflux, increase the level of acidity of the pH of saliva which attacks enamel and dentin.
However, there are also other conditions in which the pH tends to decrease: for example at night, particularly for those who sleep with their mouth open, or after having practiced an endurance sporting activity that reduces the production of saliva, and consequently increase the risk of demineralization. An acidic oral environment is the ideal condition for bacterial proliferation which leads to increase in plaque, the primary cause of tooth decay. Maintaining the physiological pH of the mouth unaltered is an essential condition for protecting the teeth from dental erosion and consequently from the damage that this can cause, including, in particular, an increase in dentinal sensitivity and yellowing of the teeth due to the gradual exposure of the dentin to external agents.

THE SOLUTION

The Curasept Biosmalto Erosion Protection line, toothpaste, mousse mouthwash is enriched with functional substances that allow protection of the enamel from acid erosion in the presence of outside risk factors (e.g. gastroesophageal reflux, eating disorders) and inside (e.g. acid diet). **Curasept Biosmalto Erosion Protection** with its innovative formula allows to create a protective film on the enamel, protecting it from acidity and regulating the oral pH thanks to the presence of the Phosphate Buffer and Carnosine **(BIO-BALANCE COMPLEX).** The Phosphate Buffer has the function of balancing the pH variations in the event of changes in acidity levels or basic substance, restoring to physiological levels. Carnosine is a dipeptide, that is, a small molecule made up of two amino acids: alanine and histidine. This has strong antioxidant properties and is often used to counteract free radicals responsible for premature aging of cells. Also boasting alkalizing effects (increases pH), L-carnosine also helps regulate pH and in combination with the Phosphate Buffer system, it also has a strong buffering capacity that helps regulate salivary pH, preserving oral health. Furthermore, the presence of Fluoride and Calcium Salts allows to maintain the mineralization of the enamel.

Why a mousse mouthwash?

The choice to use a mousse mouthwash is due to the need to delicately envelop the hard tissues of the tooth without damaging the film that forms with the use of toothpaste, for a protective effect that lasts over time. It is recommended to use **Curasept Biosmalto Erosion Protection** toothpaste and mouthwash together daily after every meal and in the presence of risk factors, even when away from home and before going to sleep. **The Curasept Biosmalto Erosion Protection line** can also be used to maintain the results obtained with the **Curasept Biosmalto Sensitive Teeth** professional and home treatment line.
